

Name : Thonduru sushma

Reg no : 192325135

Dept : AIML

code : CSA0389

course : Data structures

Faculty Name : Dr. Ashok kumar

Assignment no : 02

Submission date : 5/08/24

i) Perform the following operations using stack. Assume the size of the stack is 5 and having a value of 22, 55, 33, 66, 88 in the stack from a position to size 1. Now perform the following operations.

1) Invert the elements in the stack, 2) POP[3, 3) POP[], 3) POP[], 4) PUSH[90], 5) PUSH[36], 6) PUSH[11], 7) PUSH[88], 8) POP[], 9) POP[]. Draw the diagram of stack and illustrate the above operations and identifying where the top is?

A) Size of the stack : 5
elements in stack (from bottom to top) : 22, 55, 33, 66, 88
Top of stack : 88

Operations:-

1) Insert the elements in the stack:

→ The operation will reverse the order of elements in the stack.

→ After inversion, the stack will look like

2. POP():

→ remove the top elements (22)

55	← TOP
33	
66	
88	

3. POP():

→ remove the elements (55).

33
66
88

4. POP:

→ remove the top elements (33)

stack after pop.

66	← TOP
88	

5. PUSH(90):

→ PUSH the elements 90 onto the stack

stack after PUSH

90	← TOP
66	
88	

6. PUSH(36):

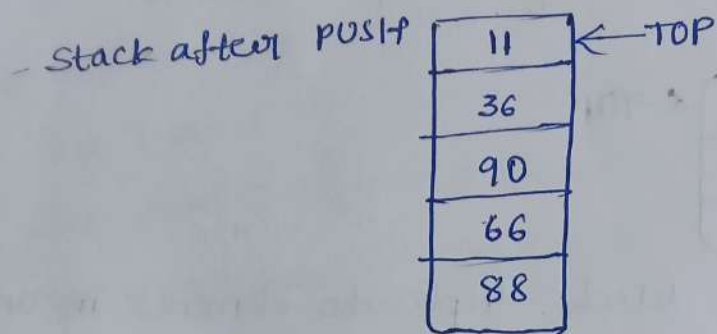

→ PUSH the element 36 onto the stack.

stack after PUSH

36	← TOP
90	
66	
88	

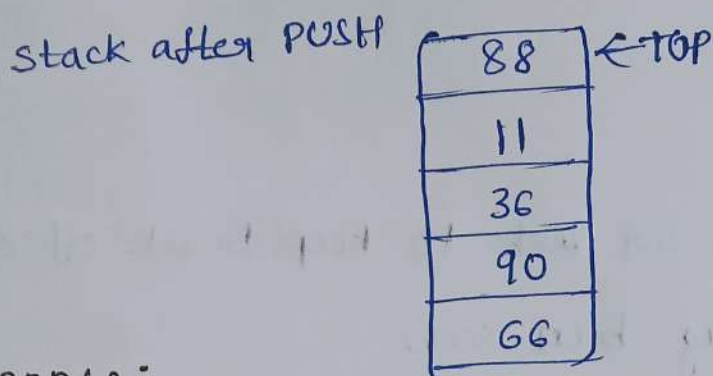

7. PUSH(11):

→ PUSH the element 11 onto the stack.

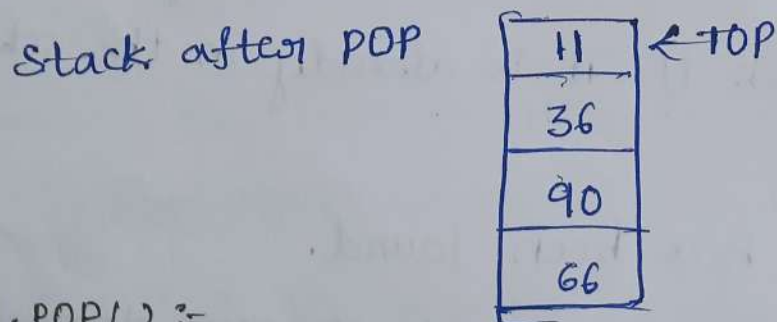

8. PUSH(88):

→ PUSH the element 88 onto the stack.

9. POP():

→ Removes the top element (88)

10. POP():

→ removes the top element (11)

Stack after POP

Final stack state:

size of stack: 5

elements in stack (from bottom to top): 36, 90, 66

Top of stack: 66

- 2) Develop an algorithm to detect duplicate elements in an unsorted array linear search. Determine the time complexity and discuss how you would optimize this process.

Algorithm:

1) Initialization:

Create an empty set or list to keep track of elements that have already been seen.

2) Linear search:

Iterate through each element of the array.

- For each element, check if it is already in the set of seen elements.
- If it is, a duplicate has been found.
- If it is found, add it to the set of seen elements.

3) Output:

Return the list of duplicates, or simply indicate that duplicates exist.

C code:

```
#include <stdio.h>
#include <stdbool.h>

int main() {
    int arr[] = {4, 5, 6, 7, 8, 5, 4, 9, 10};
    int size = size of (arr) / size of (arr[0]);
    bool seen[1000] = {false};
    for (int i = 0; i < size; i++)
        if (seen[arr[i]])
            printf("Duplicate found: %d\n", arr[i]);
        else
            seen[arr[i]] = true;
    return 0;
}
```

Time complexity :-

The linear search complexity :-

The time complexity for this algorithm is $O(n)$, where 'n' is the number of elements in the array. This is because each element is checked only once and operations (checking for membership and adding to a set) are on the average.

Space complexity:-

The space complexity is $O(n)$ due to the additional space used by the 'seen' and 'duplicates' sets, which may store upto 'n' elements in the worst case.

Optimization:-

Hashing

The use of a set for checking the duplicates is already efficient because sets provide average $O(1)$ time complexity for membership tests and insertions.

Sorting:-

If we are allowed to modify the array, another approach is to sort the array first and then perform a linear scan to find duplicates.

Sorting would take $O(n \log n)$ time, and the subsequent scan would take $O(n)$ time. This approach uses less space (a little additional space if sorting in place).
